

Java's [BitSet](#) class implements a vector of bit values (i.e.: *false* (0) or *true* (1)) that grows as needed, allowing us to easily manipulate bits while optimizing space (when compared to other collections). Any element having a bit value of **1** is called a *set bit*.

Given **2** BitSets,  $B_1$  and  $B_2$ , of size  $N$  where all bits in both BitSets are initialized to **0**, perform a series of  $M$  operations. After each operation, print the number of *set bits* in the respective BitSets as two space-separated integers on a new line.

### Input Format

The first line contains **2** space-separated integers,  $N$  (the length of both BitSets  $B_1$  and  $B_2$ ) and  $M$  (the number of operations to perform), respectively.

The  $M$  subsequent lines each contain an operation in one of the following forms:

- [AND](#) <set> <set>
- [OR](#) <set> <set>
- [XOR](#) <set> <set>
- [FLIP](#) <set> <index>
- [SET](#) <set> <index>

In the list above, <set> is the integer **1** or **2**, where **1** denotes  $B_1$  and **2** denotes  $B_2$ . <index> is an integer denoting a bit's index in the BitSet corresponding to <set>.

For the binary operations *AND*, *OR*, and *XOR*, operands are read from left to right and the BitSet resulting from the operation replaces the contents of the *first operand*. For example:

```
AND 2 1
```

$B_2$  is the left operand, and  $B_1$  is the right operand. This operation should assign the result of  $B_2 \wedge B_1$  to  $B_2$ .

### Constraints

- $1 \leq N \leq 1000$
- $1 \leq M \leq 10000$

### Output Format

After each operation, print the respective number of *set bits* in BitSet  $B_1$  and BitSet  $B_2$  as **2** space-separated integers on a new line.

### Sample Input

```
5 4
AND 1 2
SET 1 4
FLIP 2 2
OR 2 1
```

### Sample Output

```
0 0
1 0
1 1
1 2
```

### Explanation

Initially:  $N = 5$ ,  $M = 4$ ,  $B_1 = \{0, 0, 0, 0, 0\}$ , and  $B_2 = \{0, 0, 0, 0, 0\}$ . At each step, we print the respective number of *set bits* in  $B_1$  and  $B_2$  as a pair of space-separated integers on a new line.

$M_0 = \text{AND } 1 \ 2$

$B_1 = B_1 \wedge B_2 = \{0, 0, 0, 0, 0\} \wedge \{0, 0, 0, 0, 0\} = \{0, 0, 0, 0, 0\}$

$B_1 = \{0, 0, 0, 0, 0\}$ ,  $B_2 = \{0, 0, 0, 0, 0\}$

The number of *set bits* in  $B_1$  and  $B_2$  is 0.

**$M_1 = SET\ 1\ 4$**

Set  $B_1[4]$  to *true* (1).

$B_1 = \{0, 0, 0, 0, 1\}$ .  $B_2 = \{0, 0, 0, 0, 0\}$ .

The number of *set bits* in  $B_1$  is 1 and  $B_2$  is 0.

**$M_2 = FLIP\ 2\ 2$**

Flip  $B_2[2]$  from *false* (0) to *true* (1).

$B_1 = \{0, 0, 0, 0, 1\}$ .  $B_2 = \{0, 0, 1, 0, 0\}$ .

The number of *set bits* in  $B_1$  is 1 and  $B_2$  is 1.

**$M_3 = OR\ 2\ 1$**

$B_2 = B_2 \vee B_1 = \{0, 0, 1, 0, 0\} \vee \{0, 0, 0, 0, 1\} = \{0, 0, 1, 0, 1\}$ .

$B_1 = \{0, 0, 0, 0, 1\}$ .  $B_2 = \{0, 0, 1, 0, 1\}$ .

The number of *set bits* in  $B_1$  is 1 and  $B_2$  is 2.
