

Marc loves cupcakes, but he also likes to stay fit. Each cupcake has a calorie count, and Marc can walk a distance to expend those calories. If Marc has eaten  $j$  cupcakes so far, after eating a cupcake with  $c$  calories he must walk *at least*  $2^j \times c$  miles to maintain his weight.

For example, if he eats 3 cupcakes with calorie counts in the following order:  $[5, 10, 7]$ , the miles he will need to walk are  $(2^0 * 5) + (2^1 * 10) + (2^2 * 7) = 5 + 20 + 28 = 53$ . This is not the minimum, though, so we need to test other orders of consumption. In this case, our minimum miles is calculated as  $(2^0 * 10) + (2^1 * 7) + (2^2 * 5) = 10 + 14 + 20 = 44$ .

Given the individual calorie counts for each of the cupcakes, determine the minimum number of miles Marc must walk to maintain his weight. Note that he can eat the cupcakes *in any order*.

### Function Description

Complete the `marcsCakewalk` function in the editor below. It should return a long integer that represents the minimum miles necessary.

`marcsCakewalk` has the following parameter(s):

- *calorie*: an integer array that represents calorie count for each cupcake

### Input Format

The first line contains an integer  $n$ , the number of cupcakes in *calorie*.

The second line contains  $n$  space-separated integers *calorie*[ $i$ ].

### Constraints

- $1 \leq n \leq 40$
- $1 \leq c[i] \leq 1000$

### Output Format

Print a long integer denoting the minimum number of miles Marc must walk to maintain his weight.

### Sample Input 0

```
3
1 3 2
```

### Sample Output 0

```
11
```

### Explanation 0

Let's say the number of miles Marc must walk to maintain his weight is *miles*. He can minimize *miles* by eating the  $n = 3$  cupcakes in the following order:

1. Eat the cupcake with  $c_1 = 3$  calories, so *miles*  $= 0 + (3 \cdot 2^0) = 3$ .
2. Eat the cupcake with  $c_2 = 2$  calories, so *miles*  $= 3 + (2 \cdot 2^1) = 7$ .
3. Eat the cupcake with  $c_0 = 1$  calories, so *miles*  $= 7 + (1 \cdot 2^2) = 11$ .

We then print the final value of *miles*, which is 11, as our answer.

### Sample Input 1

```
4
7 4 9 6
```

### Sample Output 1

```
79
```

### Explanation 1

$$(2^0 * 9) + (2^1 * 7) + (2^2 * 6) + (2^3 * 4) = 9 + 14 + 24 + 32 = 79$$
