

Given an array of integers, determine whether the array can be sorted in *ascending order* using only one of the following operations one time.

1. Swap two elements.
2. Reverse one sub-segment.

Determine whether one, both or neither of the operations will complete the task. If both work, choose *swap*. For instance, given an array **[2, 3, 5, 4]** either swap the **4** and **5**, or reverse them to sort the array. Choose swap. The Output Format section below details requirements.

### Function Description

Complete the *almostSorted* function in the editor below. It should print the results and return nothing.

*almostSorted* has the following parameter(s):

- *arr*: an array of integers

### Input Format

The first line contains a single integer *n*, the size of *arr*.

The next line contains *n* space-separated integers *arr[i]* where  $1 \leq i \leq n$ .

### Constraints

$$2 \leq n \leq 100000$$

$$0 \leq arr[i] \leq 1000000$$

All *arr[i]* are distinct.

### Output Format

1. If the array is already sorted, output *yes* on the first line. You do not need to output anything else.
2. If you can sort this array using one single operation (from the two permitted operations) then output *yes* on the first line and then:

**a.** If elements can be swapped, *d[l]* and *d[r]*, output *swap l r* in the second line. *l* and *r* are the indices of the elements to be swapped, assuming that the array is indexed from **1** to *n*.

**b.** Otherwise, when reversing the segment *d[l...r]*, output *reverse l r* in the second line. *l* and *r* are the indices of the first and last elements of the subsequence to be reversed, assuming that the array is indexed from **1** to *n*.

*d[l...r]* represents the sub-sequence of the array, beginning at index *l* and ending at index *r*, both inclusive.

If an array can be sorted by either swapping or reversing, choose swap.

3. If you cannot sort the array either way, output *no* on the first line.

### Sample Input 1

```
2
4 2
```

### Sample Output 1

```
yes
swap 1 2
```

### Explanation 1

You can either *swap(1, 2)* or *reverse(1, 2)*. You prefer swap.

### Sample Input 2

3  
3 1 2

### Sample Output 2

no

### Explanation 2

It is impossible to sort by one single operation.

### Sample Input 3

6  
1 5 4 3 2 6

### Sample Output 3

yes  
reverse 2 5

### Explanation 3

You can reverse the sub-array  $d[2...5] = "5\ 4\ 3\ 2"$ , then the array becomes sorted.
