

Static initialization blocks are executed when the class is loaded, and you can initialize static variables in those blocks.

It's time to test your knowledge of *Static initialization blocks*. You can read about it [here](#).

You are given a class *Solution* with a *main* method. Complete the given code so that it outputs the area of a parallelogram with breadth ***B*** and height ***H***. You should read the variables from the standard input.

If ***B*** ≤ 0 or ***H*** ≤ 0 , the output should be `"java.lang.Exception: Breadth and height must be positive"` without quotes.

Input Format

There are two lines of input. The first line contains ***B***: the breadth of the parallelogram. The next line contains ***H***: the height of the parallelogram.

Constraints

- $-100 \leq B \leq 100$
- $-100 \leq H \leq 100$

Output Format

If both values are greater than zero, then the *main* method must output the area of the *parallelogram*. Otherwise, print `"java.lang.Exception: Breadth and height must be positive"` without quotes.

Sample input 1

```
1
3
```

Sample output 1

```
3
```

Sample input 2

```
-1
2
```

Sample output 2

```
java.lang.Exception: Breadth and height must be positive
```
