An array,  $\boldsymbol{A}$ , is defined as follows:

- $ullet A_0=0 \ ullet A_x=A_{x-1}\oplus x$  for x>0 , where  $\oplus$  is the symbol for  $ext{XOR}$

You will be given a left and right index l r. You must determine the XOR sum of the segment of A as  $A[l] \oplus A[l+1] \oplus \ldots \oplus A[r-1] \oplus A[r]$ .

For example, A=[0,1,3,0,4,1,7,0,8]. The segment from l=1 to r=4 sums to  $1\oplus 3\oplus 0\oplus 4=6$ 

Print the answer to each question.

# **Function Description**

Complete the xorSequence function in the editor below. It should return the integer value calculated.

xorSequence has the following parameter(s):

- *l*: the lower index of the range to sum
- *r*: the higher index of the range to sum

# **Input Format**

The first line contains an integer  $\boldsymbol{q}$ , the number of questions.

Each of the next q lines contains two space-separated integers, l[i] and r[i], the inclusive left and right indexes of the segment to query.

### **Constraints**

$$1 \le q \le 10^5 \ 1 \le l[i] \le r[i] \le 10^15$$

## **Output Format**

On a new line for each test case, print the XOR-Sum of A's elements in the inclusive range between indices l[i] and r[i].

## Sample Input 0

3

2 4

## Sample Output 0

7 15

## **Explanation 0**

The beginning of our array looks like this: A = [0, 1, 3, 0, 4, 1, 7, 0, 8, 1, 11, ...]

Test Case 0:

$$3 \oplus 0 \oplus 4 = 7$$

Test Case 1:

$$3 \oplus 0 \oplus 4 \oplus 1 \oplus 7 \oplus 0 \oplus 8 = 9$$

Test Case 2:

$$1 \oplus 7 \oplus 0 \oplus 8 \oplus 1 = 15$$

```
Sample Input 1
3
3 5
4 6
15 20
Sample Output 1
5
2
22
Explanation 1
```

 $A = [0,1,3,0,4,1,7,0,8,1,11,0,12,1,15,0,16,1,19,0,20,1,23,0,24,1,\dots].$  Perform the xor sum on each interval:  $3-5:0\oplus 4\oplus 1=5\\ 4-6:4\oplus 1\oplus 7=2\\ 15-20:0\oplus 16\oplus 1\oplus 19\oplus 0\oplus 20=22$
