A tree of P nodes is an un-directed connected graph having P-1 edges. Let us denote R as the root node. If A is a node such that it is at a distance of L from R, and R is a node such that it is at at distance of L+1 from R and A is connected to B, then we call A as the parent of B.

Similarly, if A is at a distance of L from R and B is at a distance of L+K from R and there is a path of length K from A to B, then we call A as the K<sup>th</sup> parent of B.

Susan likes to play with graphs and Tree data structure is one of her favorites. She has designed a problem and wants to know if anyone can solve it. Sometimes she adds or removes a leaf node. Your task is to figure out the  $K^{\text{th}}$  parent of a node at any instant.

### **Input Format**

The first line contain an integer T denoting the number of test cases. T test cases follow. First line of each test case contains an integer P, the number of nodes in the tree. P lines follows each containing two integers X and Y separated by a single space denoting Y as the parent of X. If Y is 0, then X is the root node of the tree. (0 is for namesake and is not in the tree).

The next line contains an integer Q, the number of queries.

Q lines follow each containing a query.

- $0 \ Y \ X : X$  is added as a new leaf node whose parent is Y : X is not in the tree while Y is in.
    $1 \ X :$  This tells that leaf node X is removed from the tree. X is a leaf in the tree.
- $2 \ X \ K$ : In this guery output the  $K^{ ext{th}}$  parent of X. X is a node in the tree.

#### Note

• Each node index is any number between 1 and 10<sup>5</sup> i.e., a tree with a single node can have its root indexed as  $10^5$ 

#### **Constraints**

$$\begin{array}{l} 1 \leq T \leq 3 \\ 1 \leq P \leq 10^5 \\ 1 \leq Q \leq 10^5 \\ 1 \leq X \leq 10^5 \\ 0 \leq Y \leq 10^5 \\ 1 < K < 10^5 \end{array}$$

### **Output Format**

For each guery of type 2, output the  $K^{th}$  parent of X. If  $K^{th}$  parent doesn't exist, output 0 and if the node doesn't exist, output 0.

# **Sample Input**

```
2
7
3 5
8 2
10
0 5 15
2 15 2
1 3
0 15 20
0 20 13
2 13 4
2 13 3
2 6 10
2 11 1
2 9 1
```

```
1
10000 0
3
0 10000 4
1 4
2 4 1
```

#### **Sample Output**

## **Explanation**

There are 2 test cases. The first test case has 7 nodes with 2 as its root. There are 10 queries

- 0 5 15 -> 15 is added as a leaf node to 5.
- 2 15 2 -> 2nd parent of 15 is 15->5->2 is 2.
- 1 3 -> leaf node 3 is removed from the tree.
- 0 15 20 -> 20 is added as a leaf node to 15.
- 0 20 13 -> 13 is added as a leaf node to 20.
- 2 13 4 -> 4th parent of 13 is 2.
- 2 13 3 -> 3rd parent of 13 is 5.
- 2 6 10 -> there is no 10th parent of 6 and hence 0.
- 2 11 1 -> 11 is not a node in the tree, hence 0.
- 2 9 1 -> 9's parent is 8.

the second testcase has a tree with only 1 node (10000).

- 0 10000 4 -> 4 is added as a leaf node to 10000.
- 1 4 -> 4 is removed.
- 2 4 1 -> as 4 is already removed, answer is 0.
